INVESTIGATION, REMEDIATION & OUTCOME

Mini SOC Lab Case Study | 31 October 2026

FINDING 01 | HIDDEN TCP PORT 55555

Mac endpoint rootcheck raised a warning for TCP port 55555.
Follow-up lsof/netstat checks returned no matching process or connection.
This does not prove the historical alert was false. Status: unresolved.

FINDING 02 | WORLD-WRITABLE VPN LOGS

Two Pulse Secure logs were root-owned, group wheel, mode 0666.
Corrective action: chmod 640 on both files.
Verification: ls -l showed -rw-r----- for each file.
Status: permissions remediated. Recheck VPN logging if used later.

FIM CONFIGURATION RESTORATION

Scan frequency restored: 120 seconds -> 43,200 seconds (12 hours).
Backup created; diff confirmed only intended frequency change.
wazuh-agentd -t returned exit code 0.
Agent restarted successfully; five components reported running.

CONCLUSION AND FOLLOW-UP

Custom detection verified. Insecure log permissions were corrected.
Investigate recurring rootcheck events and the prior hidden-port alert.
Do not classify the entire rootcheck population as false positive yet.

GitHub: github.com/ftamanna789/netops-one
Evidence basis: terminal outputs from the controlled lab; no raw private logs.
